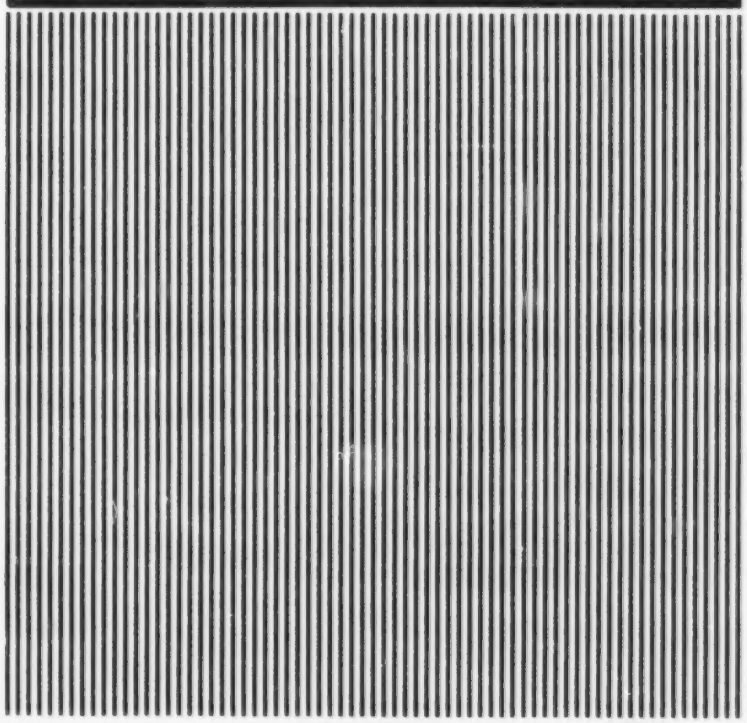
1989 TEST AND REFERENCE SIRES

PPP

PROGENY PROVING PROGRAM



Manitoba Agriculture

Manitoba's "Triple P" Program

- a national leader in beef sire evaluation

PPP is Manitoba's Young Beef Sire Progeny Proving Program. Initiated in 1976 by Manitoba Agriculture in consultation with the Manitoba Advisory Board for Beef Cattle Improvement, the 1989 breeding season will mark PPP's 13th year of operation. Since its inception, the primary aim of PPP has been to identify Manitoba's genetically superior young purebred beef sires.

PPP is the third in a series of performance testing programs offered by Manitoba Agriculture. In association with Federal-Provincial ROP Home-Herd Testing and post-weaning evaluation at seven bull test stations, PPP offers Manitoba beef producers the opportunity to significantly improve the genetic performance of their herd.

As indicated by its name, PPP is a progeny testing program. Test sires are evaluated through the performance of their offspring. **To be eligible for the program, test sires must meet rigid selection criteria.** They must:

- **be born and raised in Manitoba**
- **have complete birth to weaning ROP home-test data**
- **have completed testing at one of Manitoba's bull test stations and have placed in the top ten per cent of their breed (minimum of 30 contemporaries) for the combined index of weight per day of age (WPDA) and average daily gain (ADG)**
- **meet minimum scrotal circumference measurements and have, in the opinion of the selection committee, a reasonable birth weight**
- **meet breed conformation standards and pass health and productive examinations**

PPP evaluates test sires by comparing the performance of their progeny to the performance of progeny from nationally proven reference sires on a within-herd and provincial basis. Data is collected on all PPP sired calves through the Federal-Provincial ROP program, Calves are evaluated from birth to yearling age for calving ease, birth weight, weaning weight and yearling weight. This information is used by Agriculture Canada through the National Sire Monitoring Program to generate progeny proofs on the PPP test sires.

Progeny Proofs

A progeny proof is a very useful tool which a breeder can utilize to estimate the genetic worth of a bull. A progeny proof evaluates three traits: calving ease, gain to weaning and gain to yearling.

To illustrate how a progeny proof works, consider the 1980 Hereford test sire - Britisher B Marquis 11K, bred and owned by Hay's Herefords of Pipestone, Manitoba.

Sire Name	Reg. No.	Tattoo	Calving Ease	Weaning Weight	Yearling Weight
Britisher B Marquis 11K	**1787497**	**MYZ 11K**	**0**	**+3**	**+4**

For calving ease, this bull has Predicted Difference (PD) of 0. For the Hereford breed, a zero proof means you can expect 82 per cent and 97 per cent unassisted calvings with two-year-old heifers and five-year-old (or older) cows (covering all breeds of dam) respectively. A negative proof indicates that compared to the average Hereford bull, you can expect an increased incidence of calving problems. A positive proof means the bull is above breeding average for calving ease i.e. he is an "easy calver".

The weaning and yearling weight proofs are interpreted a little differently. They are expressed in pounds of gain from birth to weaning or birth to yearling. A producer using Britisher B Marquis 11K with a +3 in the PD column for weaning weight, can expect calves from this bull to gain five pounds more on average than calves from a bull of the same breed with a PD of 0 pounds. Similarly, yearling weights for progeny from this bull should be 4 pounds heavier than those from progeny from an average bull.

One of the most important PPP benefits is the reduced length of time it takes to receive a proof on a test sire. Normally it takes seven to eight years to obtain a proof on a bull. **Through PPP, a proof can be obtained in two to three years.** Identification of superior bulls at three to four years of age provides the opportunity for widespread use throughout the province in both purebred and commercial herds.

To date, approximately, 13,000 cows have been bred to PPP test and reference sires. Utilization of PPP semen throughout the province represents a major improvement in the breeding program of the cooperating cow herds. Top performing bulls are used which might otherwise be unavailable or unaffordable. A sound breeding program which incorporates PPP, will have a lasting effect on the genetic performance of the herds involved.

Plan now to cash in on the superior gains offered through PPP. Complete information on the 1989 test and reference sires is available in this booklet.

Enrollment Regulations

To enroll in the program, herds must be located in Manitoba. Commercial or purebred females (or combinations of each) are accepted. A minimum of 18 females must be enrolled, with a maximum enrollment of 100 cows. Cow numbers may be limited further if reference sire semen is in short supply. Cow herd owners must use artificial insemination, pay insemination costs and enroll on the Federal-Provincial ROP Program. Semen is provided free of charge, in exchange for performance information on PPP-sired calves.

The following is a breakdown of the PPP Cow Herd Owner Agreement.

YEAR 1

- Semen is distributed by the Manitoba Semen Distribution Centre
- A maximum of two breedings per cow is allowed.
- Use two vials of test semen for every one vial of reference semen.
- Cows must be bred to test and reference sires in a random order.
- Breeding season must be restricted to 90 days.
- When breeding is complete, return unused semen and breeding slips.

YEAR 2

- Collect birth information (birth dates, weights and calving ease).
- Collect weaning weights and record on ROP records.
- Process records before November 1 for spring calving herds; February 1 for fall calving herds.

YEAR 3

- Record yearling weights and mail in completed ROP records.

- Agreement is completed

Application forms can be found at the back of this booklet. Send completed applications to Beef Program Specialist, Manitoba Agriculture, 545 University Crescent, Winnipeg, Manitoba, R3T 5S6.

PROGENY PROVING PROGRAM

1989 PPP *REFERENCE SIRES*

PLEASE NOTE:

You may use any Reference Sire not included in this summary subject to the following conditions;

1. The selected Reference Sire must have a complete progeny proof listed in the National Sire Monitoring Program Summary.

2. The herd owner must pay the cost of such semen and any signing fees required. (PPP offers free semen only for Reference Sires listed in this summary.)

If you select a special Reference Sire, check with this office for approval.
